CE01ISSM		2014-04-17T20:53:00		For telemetered and recovered_host data, a race condition exists in the CPM firmware when transferring daily log files harvested from the various sub-components in a buoy system over the Iridium RUDICS connection. Data accumulates in the daily log files for an instrument, but only one record is transmitted to shore. Therefore, telemetered and recovered_host data are sparse (if available at all), but the recovered_instrument datasets should contain all available data.		8151	Need to add end date when this is fixed - probably spring 2017

See platform level annotation for details. In addition, instruments and nodes were shut down around 2/6/2017 to conserve power due to unanticipated battery drain on the mooring.
